        Peptides R90945-64 are derived from the factor VIII protein, esp. from a modified Factor VIII in which residues Ala322-Ser750, Leu1655-Arg1689, Lys1694-Pro1782 and Asp2170-Tyr2332 are deleted. The modified Factor VIII and derived peptides can be used to prevent the activity of inhibitors of factor VIII binding to on Willebrand factor, esp. antibodies, thus preventing or treating immune disorders.

This sequence represent a biologically active peptide derived from the 5'-AMP-activated protein kinase (AMPK) catalytic alphal subunit from pig liver. This fragment retains at least one of the activities of native. AMPK-alphal i.e the ability to stimulate phosphorylation of picinin molecules and the ability to mimic the binding of native AMPK-alphal i.e the ability to mimic the binding of native AMPK-alphal to at least one antibody or ligand molecule. AMPK polypeptides can be used to identify compounds which regulate the action of kinases. Such fragments can be used to reduce biosynthesis of cholesterol and intity acids. They may also be used to inhibit the release of these molecules from intracellular stores by hormone sensitive lipses (HSL). They may also be used to reduce cellular malonyl CoA levels and promote the beta-oxidation of fatty acids by mitochondria. AMPK-alphal fragments could be used in the treatment of e.g. hypercholesterolaemia, coesity, clinical syndromes associated with hypoxia or ischaemia (e.g. myocardial infarction) disorders of nutrition and
                               develop products for treating e.g. hyper-cholesterolaemia, obesity, hypoxia, ischaemia, nutrition disorders or diabetes mellitus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New poly:nucleotide(s) encoding megakaryocyte tyrosine kinase(s) used to develop prods. for the treatment and diagnosis of kinase related signal transduction abnormalities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

comprise expressing a protein having a transcription factor nuclear
localisation signal and determining the degree of nuclear
                                                                                                                                                                                                                                                                            The present sequence was used in the development of a novel assay comprises expressing in a cell a protein comprising the E region and sufficient C-terminal residues of a DP-3 protein to provide a functional nuclear localisation signal (NLS), or the NLS of E2F-1, and a marker for nuclear localisation. Then the degree of nuclear localisation in the presence and absence of the putative regulator is determined. Regulators identified using the assay can be used as potential regulators of cell proliferation, or as models for rational drug design. Regulation of the NLS may lead to effects such as enhanced cell division, blocking of cell cycle progression or apoptosis. The regulators may also be used to design other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a human twenty-five C associated protein kinase I (TcAKI) antibody internal C-terminal peptide from the present invention. The present invention also describes: creating a creating an expect invention. Bubstrate by incubating the substrate in a cell transformed with the TaCKI DNA sequence, such that a 14-3-3 recognition motif is created in the substrate in a 14-3-3 protein on a 14-3-3 protein or a TcAKI substrate, where the mutation prevents or interferes with phosphorylation-specific interaction between the 14-3-3 protein and the TcAKI substrate, by: (a) incubating the 14-3-3 protein and the TcAKI substrate which is suspected of being mutated in a cell transformed with the TcAKI DNA sequence such that the 14-3-3 protein and the TcAKI substrate which is suspected of being mutated in a cell transformed with the TcAKI DNA sequence such that the 14-3-3 protein and TcAKI substrate of interaction with the level obtained with a non-mutant component, and (c) diagnosing a mutation in either the 14-3-3 protein or TcAKI substrate with the nevel of interaction differs significantly from the level obtained with the non-mutant components. TcAKI has a role in mediating interaction between 14-3-3 proteins involved creates a 14-3-3 recognition motif and other cellular proteins involved
                                                                                                                                                                 .;

The mutations result in non-infectious HIV-1 particles. Inactive, protease-deficient HIV-1 particles containing at least one of Nef truncated protein fragments are used as immunogens, particularly for reducing or preventing apoptosis in HIV-1 sero-negative or positive subjects, specifically those with HIV-1 infection, both for preventing and treatment. Fragments of nef gene and fragments encoding specific mutant Nef proteins are also useful in hybridisation tests for diagnostic detection of mutated genes in (lysed) cells or body fluids, while the antibodies. The proteats are detected in immunoassays using antibodias. The protease deficient HIV-1 particles and antibodies, optionally attached to a radiolosotope, chemotherapeutic agent or toxin, can be used to reduce the severity of HIV infections.
                                                                                                                                                                                                                                                                           the defective human immunodeficiency virus-1 (HTV-1) provirus in L-2 cells. They represent the portions of pol protease (prot.), vpr. env (9p120 and 9p41), and nef gene regions that were mutated as compared type HTV-1 in LAI or MOVIAI cells. The invention relates to mutuched DNA, proteins or fragments of defective HIV-1 provirus in L-2 cell line.
                                                                                                             New nucleic acid encoding mutant or truncal {}^{i,j} torms of human immune deficiency virus proteins - used to generate non-infectious particles useful as therapeutic or prophylactic immunogens, also for
                                                                                                                                                                                                                                                               Sequences W87475 to W87463 represent mutant amino acid sequences of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This peptide is an example of a peptide which binds to a human leucocyte antigen HLA-D04 molecule. The peptide was isolated from a phagemid combinatorial library comprising the sequence V05953, by screening with an HLA-D04 molecule. The peptide is used for the treatment of autoimmune disease, or especially for treatment of viral diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel method for the diagnosis of a disease caused by, or associated with, an RNA molecule that has a frameshift
The interaction of a lipid kinase, such as PI 3-kinase or PI 4-kinase, with CD4-P56lck, may be blocked by administering a peptide. This peptide may be a fragment of the cytoplasmic domain of CD4 (eg R60987-R60991), a fragment of p56lck (eg R60992, R60993), a fragment of PI 3-kinase (eg R60994, R60995), or a fragment of PI 4-kinase. Other proline-rich peptides that bind to SH3 binding sequences can also be used, such as the fragment of 3BPI protein that binds to the SH3 of the AbI kinase (R60997), or a sequence found in the SOS protein (R60999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Diagnosing disease by detecting frameshift mutations in RNA or corresponding protein mutations - used to diagnose cancer and neurological diseases, particularly Alzheimer's disease, and also for treatment and prevention with specific ribozymes or wild-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     high mobility group protein-C; neuroendocrine specific protein A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             In order for certain T cells to make an optimal response to antigen, it is necessary for the T cell surface antigen CD4 to couple to the protein-tyrosine kinase p551ck. (CD4-p561ck is known to associate with and functionally synergise with the TCR/CD3 complex.)CD4-p561ck complex in T cells associates with two lipid kinases significant and P1 4-kinase, which suggests that these lipid kinases are also involved in intracellular signalling via the T cell receptor complex.
                                                                                                                                                           The sequence was used as a basis for the design of probes to isolate DNA encoding the S proteins. The sequence was determined by conventional microsequencing techniques performed on protein purified from styles dissected from the flowers of the plant. The S-proteins control the self-incompatibilty reaction. They are useful in control of pollen tube growth egas natural gametocides to control, induce or promote self-incompatibilty and interspecific incompatibilty. See also P70149-P70154, N70219
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Method for inhibiting or reducing signal transduction – utilises peptide or corresp, nucleic acid which decreases association of PI 3- or 4- kinase with CD4/p561ck
                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

clonal cells from bioactive fractions. Peptides V1320 (gliadin derived peptide) and V1321 (glutenin derived peptide) were identified using these methods, and can be used in pharmaceuticals/medicinus (vaccines) for inducing tolerance to gluten, or to treat gluten-sensitivity, i.e. celiac disease (CD) or celiac sprue, tropical sprue, childhood food allergies and dermatitis herpetiformis (DH). The peptides are also useful for elimination of a group of gluten-sensitive T-cells, and for generating antibodies, T-cell receptors, anti-idiotypic B- or T-cells by immunization of a mammal with the

cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, multiple sclerosis, alcoholic liver disease, disease mallitus type II and many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients, at an early stage. It is based on the observation that disease may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including proteins protein (beta-APP), the microtubule associated proteins and Big Tau, ubiquitin B, apolipoprotein E, microtubule associated protein (GFAP), neurofilament-L, neurofilament-M, neurofilament-E, presenilin I, presenilin II, glial fibrillary acidic protein (GFAP), the cellular tumour antigen p33, B-cell leukemia/lymphoma 2 (bc1-2) proto-oncogene, semaphorin III, high mobility group protein-C (HMGP-C) and neuroendocrine specific protein A.
                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptides Y13220-13343 represents gluten derived peptides, and their variants. The specification describes a method to find and characterize peptides that are recognized by an intestinally derived gluten-sensitive T-cells. The method comprises establishing and contacting at least one gluten-sensitive T-cell clone with a mixture of gluten-derived peptides, and fractionating the mixture to select peptides that stimulate the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            R70619 is a peptide fragment derived from an HIV (Human Immunvalviticiency Virus) protein and is capable of binding to a human lymphocyte antigen. The peptide can induce killer cells which target HIV-intected rells. It is also useful in the prevention and treatment of HIV and AIDS. Anti-HIV vaccines may incorporate the peptides, or may incorporate devector (such as vaccinia or BCG) contg. DNA encoding the peptides.

Identification and NH2-terminal amino acid sequence of three "Identification and NH2-terminal amino acid sequence of three insulin-like growth factor-binding proteins in porcine serum.";
Biochem. Biophys. Res. Commun. 181:1131-1136(1991).
-!- FUNCTION: IGP-BINDING PROTEINS PROLONG THE HALF-LIFE OF THE IGFS AND HAVE BEEN SHOWN TO EITHER INHIBIT OR STIMULATE THE GROWTH PROMOTING EFFECTS OF THE IGFS ON CELL CULTURE. THEY ALTER THE INTERACTION OF IGFS WITH THEIR CELL SURFACE RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

PATENT NO. 5332671

PAPPLICANT: PERRARA, NAPOLEONE; LEUNG, DAVID W.H.

TITLE OF INVENTION: PRODUCTION OF VASCULAR ENDOTHELIAL CELL

GROWTH FACTOR AND DNA ENCODING SAME

NUMBER OF SEQUENCES: 15

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/07/389,722

FILING DATE: 04 -NUG-1989

PRIOR APPLICATION DATA:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Description

Patent No. 5932412
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: DILLNER, JOAKIM
APPLICANT: CHENG, HWRE-MIG
TITLE OF INVENTION: SYNTHETIC PEPTIDES OF HUMAN
TITLE OF INVENTION: PAPILLOMAVIRUS 1, 5, 6, 8,
TITLE OF INVENTION: 11, 16, 18, 31, 33 AND 56,
TITLE OF INVENTION: USEFUL IN IMMUNOASSAY FOR
TITLE OF INVENTION: DIAGNOSTIC PURPOSES
NUMBER OF SEQUENCES: 193
                                                                                                                                                                                                                                                                                                                                                                                                            COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible

Sequence 11, Application US/08738975

Patent No. 5880267

GENERAL INFORMATION:

APPLICANT: Funda, Michiko N.

TITLE OF INVENTION: Trophinin and Trophinin-Assisting

TITLE OF INVENTION: Proteins

NUMBER OF SEQUENCES: 22

CORRESPONDENCE ADDRESS:

ADDRESSEE: Campbell and Flores

STREET: 4370 La Jolla Village Drive, Suite 700

CITY: San Diego

STATE: California

COUNTRY: USA

ZIP: 92122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                35.7%; Score 30; DB 2; Length 9; 62.5%; Pred. No. 1.3e+05; Live 1; Mismatches 2; Indels

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

are useful in the production of this precursor. The precusor is treated with strong acid in the preparation of secretin. Secretin is one of the digestive canal hormones and is useful in promotion of pancreatic external secretin, controlling gastrin-stimulating secretin of the stomach acid, releasing insulia, stimulating secretin and decomposing fat. It is used as a pancreatic-function examining agent and a medicine for curing duodenal ulcers etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The peptide is an industrial intermediate for the production of secretin. Secretin is a digestive tract hormone. It displays pancreatic exocrinogenic, gastrin stimulating, gastric acid secretion inhibiting, insulin insulin pepsin secretion promoting and adipolytic action. It is used as a reagent for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Deca:peptide useful as intermediate for secretin - contains histidine, serine, aspartic acid, glycine, threonine, phenylalanine, glutamic acid and leucine

          Peptides R90945-64 are derived from the factor VIII protein, esp. from a modified Factor VIII in which residues Ala322-Ser750, Leu1655-Arg1689, Lys1694-Pro1782 and Asp2170-Tyr2332 are deleted. The modified Factor VIII and derived peptides can be used to prevent the activity of inhibitors of factor VIII binding to von Willebrand factor, esp. antibodies, thus preventing or treating immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence in P20398 is a precursor for the production of secretin. The peptide sequences given in P20399-402 are peptides which

The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.
                                                                                                                                                                                                                                                                                                                                                                                                                              Immunogenic peptide having a human leukocyte antigen binding motif #123.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    immune response; T cell activation; major histocompatibility complex; cytocoxic T Imphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma; vaccine; immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            infections. The peptides are therefore useful therapeutically or treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA;

This invention describes the isolation of a novel human muscarinic acetylcholine receptor 6 (mACHR-6), capable of modulating the effects of acetylcholine on acetylcholine responsive cells. mACHR-6 constant of the polypeptides may be used to detect naturally occurring mutations of the mACHR-6 gene and determine if a subject with the mutated gene is at risk of (or is predisposed to have) a mACHR-6 related disorder, modulate cell activity mediated by mACHR-6 (e.g. biological processes mediated by phosphatidylinositol turn-over and signalling), secretion of a molecule, ce.g. a neurotransmitter or a glandular enzymb, or contraction of a molecule, ce.g. a neurotransmitter or a glandular enzymb, or contraction of a molecule, ce.g. a neurotransmitter or a glandular enzymb, or contraction of a molecule, ce.g. nervous system disorders (e.g. amnesia, apraxia, agnosia, amnestic patial disorientation, Kluver-Bucy syndrome, Alzheimer's related memory loss and learning disability, visual, hallucinations, perceptual disturbances, and Levry body dementia with mood swings, and depressive illness), affective disorders, sleep abnormalities, paradoxical sleep abnormalities, paradoxical sleep abnormalities, paradoxical sleep abnormalities, cellorer contracting mechanism disorders (e.g. chornalities during sleep), pain generating mechanism disorders (e.g. characted to irritable bowel syndrome (IBS), or chest pain), movement contraction disorders (e.g. characted to irritable bowel syndrome (IBS), or chest pain), movement

insulin hypersecretion related obesity), drinking disorders (e.g. diabetic polydipsia), smooth muscle related disorders (e.g. IBS, diverticular disease, urinary incontinence, oesophageal achalasia, and chronic obstructive airways disease), cardiac disorders (e.g pathologic bradycardia or tachycardia, arrhythmia, flutter and fibrillation), and glandular disorders (e.g. xerostomia and diabetes mellitus).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence is a specific example of a group of new immunogenic peptides having an HLA-A3.2, HLA-A1, HLA-A11 or HLA-A24.1 binding motific For example, the peptides having an HLA-A3.2 binding motific each have 9-10 residues and contain, from the N-terminus to the C-terminus, (a) a first conserved residue selected from L, M, I, V, S, T, F, C, G, D and E and (b) a second conserved residue of K, R, Y, H or F, where the first and second conserved residue of separated by 6-7 residues. The peptides are capable of binding selected MHC molecules and inducing an immune response. They can be used to treat and/or prevent viral infection and cancer, e.g. prostate cancer, lymphoma, hepatitis or AIDS. They can also be used to produce antibodies for use as diagnostic or therapeutic agents. The peptides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in R47304-33 and R49201-44 are immunogenic peptides which have a HLA-A3.2, HLA-A1 or a HLA-A11 binding motif. These peptides may be used in the composition of the invention. These peptides are capable of binding selected MHC molecules and inducing an immune response. They can be used to treat and/or prevent viral infection and cancer, eg. prostate cancer, lymphoma, hepatitis or AIDS. They can also be used to produce antibodies for use as diagnostic or therapeutic agents. The peptides can also be

These peptides bind HLA-A2.1 and have a binding affinity of at least 1% as compared to a reference peptide (R71293). R61602 has an IC50 of 0.002 and the sequence occurs at position 1317 in the HBV POL protein. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg. prostate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            XEXEX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                                                                                                                                                                                                                                                                                        region 3 (CDR3) of the T cell receptor beta (TCRbeta) chain. These sequences were isolated from cerebrospinal fluid (GSF), spinal cord (SC) and lymph nodes (LN) of clones of Lewis rats with experimental autoimmune encephalomyelitis (BAE). By detecting the presence of a marker TCR vere bias in a body fluid which encapsulates all or part of the target organ, an autoimmune disease (such as a neurological disease) in a human can be identified. This method can also be carried out to detect the presence of a biased motif common to I cell receptors specific for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        system can be diagnosed. Therapeutic Vbeta peptide sequences can be selected to use as treatment of a disease or condition. The selection is carried out by identifying a Vbeta gene bias in a body fluid that is not the target tissue or organ of the disease, and selecting an immunogenic peptide corresponding to the Vbeta gene bias. Multiple sclerosis (MS) can be treated by identifying the CDR2 of a V gene peptide on the surface of a T lymphocyte in the CSF of a patient and administering a peptide corresponding to this region. These methods can also be used for the diagnosis and immune-related therapy of optical nerve damage and anterior chamber inflammation as well as other human neurological diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunogenic peptide having a human leukocyte antigen binding motif #2725.

having a human major histocompatibility complex (MHC) Class I (also having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are cormally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen fiself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to index a vertical or conditions. They are also useful diagnostically, and can be used to index a vertical or conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for influsion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
